

心理統計法特論 II

Elective 2 credit

IJJIMA, Yuudai

1. Course Description

For quantitative studies in psychology, statistical analysis is essential to investigating psychological phenomena. It is required to collect data adequately, to analyze the data, and to report these results. The aim of this lecture is to understand the importance of data in psychological research and the basic techniques of data manipulation for analysis, implication, and report. In the second semester, I lecture the statistical techniques for multivariate data using statistical software (SPSS and R).
