Special Topics in Basic Mathematics

1. Course Description

In this course we will study the foundation of Mathematics which is necessary for learning Economics or Business Administration. The course contains largely two subjects, linear algebra and mathematical analysis (integral and differential), and we will mostly put the focus on the former which will be indispensable for the input-output analysis. The latter will be very important tool for microeconomics. Each session consists of two components, 60minites lecture and 30minites exercises.
