Elective

2 credit

AKAISHI, Tamotsu

1. Course Description

It is said that science-loving teachers raise children who like science. I want students aiming for a teaching profession to like science. Therefore, I hope that the 3rd graders who are about to practice teaching and the 4th graders who are going to the educational field will be confident in science instruction through more experiences of "observation and experimentation" of science.

In this course, the syllabus is devised beyond the grade and unit structure so that you can encounter as many observation and experiment scenes as possible. The aim is for students to actually observe and experiment, and from their activities to be able to teach with confidence in actual class situations.
